## Introduction and Background

This report summarizes the findings of the traffic impact analysis (TIA) that was performed for a residential subdivision development proposed along Lyle Wilson Road (SR 1329) in Cullowhee, Jackson County, North Carolina. (Figures 1 & 2) The purpose of this study is to determine the impact of the anticipated traffic associated with this development on the adjacent road network.

Figure 1 – Region of Proposed Site Location

Figure 2 – Proposed Site

## **Proposed Site Use and Access**

The site plan consists of 50 buildings, 27 single-family units, 23 twin homes containing a total of 73 units. The residential development will have five access points onto Lyle Wilson Road (SR 1329). *Figure 3* shows the proposed site layout of the development. This proposed site plan can be found in Appendix A.

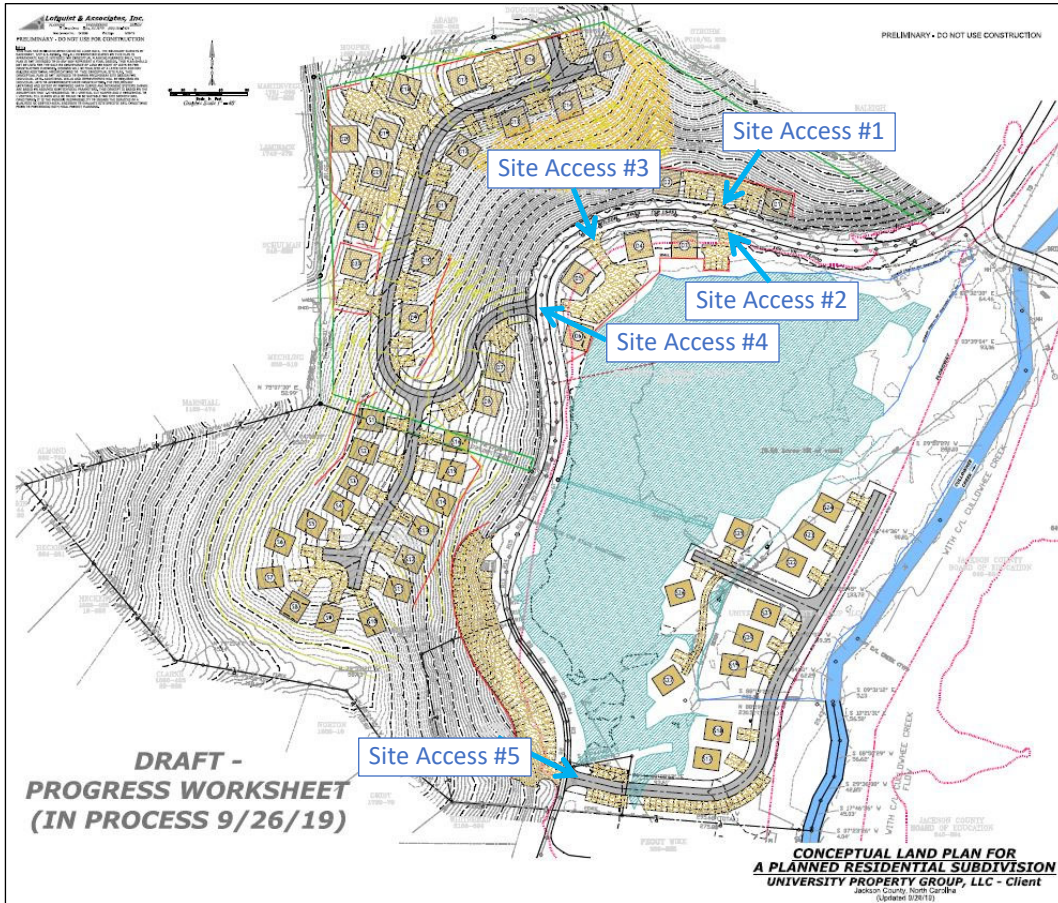

Figure 3 – Preliminary Site Plan  
Site Plan Provided by Lofquist & Associates, Inc.

## **Parameters and Study Area**

As determined through discussions with NCDOT along with engineering judgment, the study area of this TIA includes:

- NC 107 @ Lyle Wilson Road (SR 1329)

Peak hour turning movement counts (7:00 – 9:00 AM & 4:00 – 6:00 PM) were obtained at the existing studied intersection. AM and PM peak hours were determined between the AM and PM peak periods. AM and PM peak hours for the intersection were analyzed for existing, background, and full build-out traffic conditions.

The AM and PM peak hours for the studied intersection are as follows:

- NC 107 @ Lyle Wilson Road (SR 1329)
  - AM Peak Hour – 7:15 AM – 8:15 AM || PM Peak Hour – 5:00 PM – 6:00 PM

Other parameters include:

- 2022 Build-out Year
- Background Traffic Growth Factor of 2% per year
  - NCDOT standard growth factor
- Peak Hour Factor (PHF) of 0.90 for projected conditions
- Proposed site access to Lyle Wilson Road

## **Surrounding Land Uses**

The proposed site is located within Jackson County, North Carolina southeast of the Forest Hills. The immediate area surrounding the proposed site consists of student housing, single-family homesites, undeveloped land, and woodland.

## **Surrounding Roadways**

According to NCDOT's Online GIS, NC 107 is classified as "other principal arterial". NC 107 is a divided four-lane road with a posted speed limit of 45 mph. NC 107 allows traffic to travel north/south between Cullowhee and East Laport as well as other destinations to the south. According to NCDOT data, the Average Annual Daily Traffic (AADT) on NC 107 was 19,000 vehicles per day (vpd) north of Western Carolina University in 2017 and 9,500 vpd south of Lyle Wilson Road in 2018.

NCDOT's Online GIS classifies Lyle Wilson Road (SR 1329) as a local road. Lyle Wilson Road (SR 1329) is a two-lane road with a posted speed limit of 35 mph. According to NCDOT data, there is no AADT provided for Lyle Wilson Road (SR 1329).

## **Method of Analysis**

A traffic impact analysis is a method of determining the impacts of new development traffic on the surrounding roadway. This is done by comparing the effects of additional traffic generated by the site to the traffic that would normally utilize the road network upon completion of the development. This traffic is defined as background traffic.

Background traffic is defined as the traffic that would be at the studied intersections at the time of anticipated project completion (build-out), without this proposed development. Background traffic is comprised of existing traffic and any increase or decrease in volumes which might occur from general growth trends in the surrounding area or from nearby specific developments. It also assumes no significant roadway geometric changes from the existing condition scenario. A growth factor of 2% was utilized for this study up to the anticipated project completion year (build-out) of 2022. The site generated traffic is added to the background traffic in order to determine the build-out traffic for this project. These two numbers, background and build-out, are then compared to determine the overall impact that the proposed development traffic has on the roadway.

The studied intersections were analyzed using Synchro. Synchro is a specialized software package that allows the user to model intersections and roadway networks to determine levels of service (LOS), based on the thresholds specified in the Highway Capacity Manual (HCM) published by the Transportation Research Board. Synchro also provides analysis of capacity, vehicle delay, volume to capacity ratio (v/c), queue lengths, traffic signal timing, and vehicle flow rate.

Sim Traffic was also utilized, which is an extension of Synchro that allows the user to more accurately model closely spaced intersections. This animation software allows the user to view traffic circulation through the study intersections.

The HCM defines capacity as "the maximum sustainable hourly rate at which persons or vehicles reasonably can be expected to traverse a point or uniform segment of a lane or roadway during a given time period under prevailing roadway, environmental, traffic, and control conditions". LOS is a term used to represent different driving conditions, primarily with respect to traffic congestion. It is defined as a "qualitative measure describing operational and perceptual conditions within a traffic stream". LOS "A" represents free flow traffic conditions with no congestion. LOS "F" represents severely impacted traffic flow due to vehicle congestion. LOS is

generally determined by the total “Control Delay” experienced by drivers. Control delay is vehicle delay that is ultimately caused by the traffic control device. This includes deceleration delay, queue move-up time delay, stopped delay, and acceleration delay. (Table 1)

### Highway Capacity Manual Level of Service and Delay

Un-signalized Intersection		Signalized Intersection	
Level of Service	Average Control Delay Per Vehicle (Seconds)	Level of Service	Average Control Delay Per Vehicle (Seconds)
A	0-10	A	0-10
B	10-15	B	10-20
C	15-25	C	20-35
D	25-35	D	35-55
E	35-50	E	55-80
F	> 50	F	> 80

<Table 1>

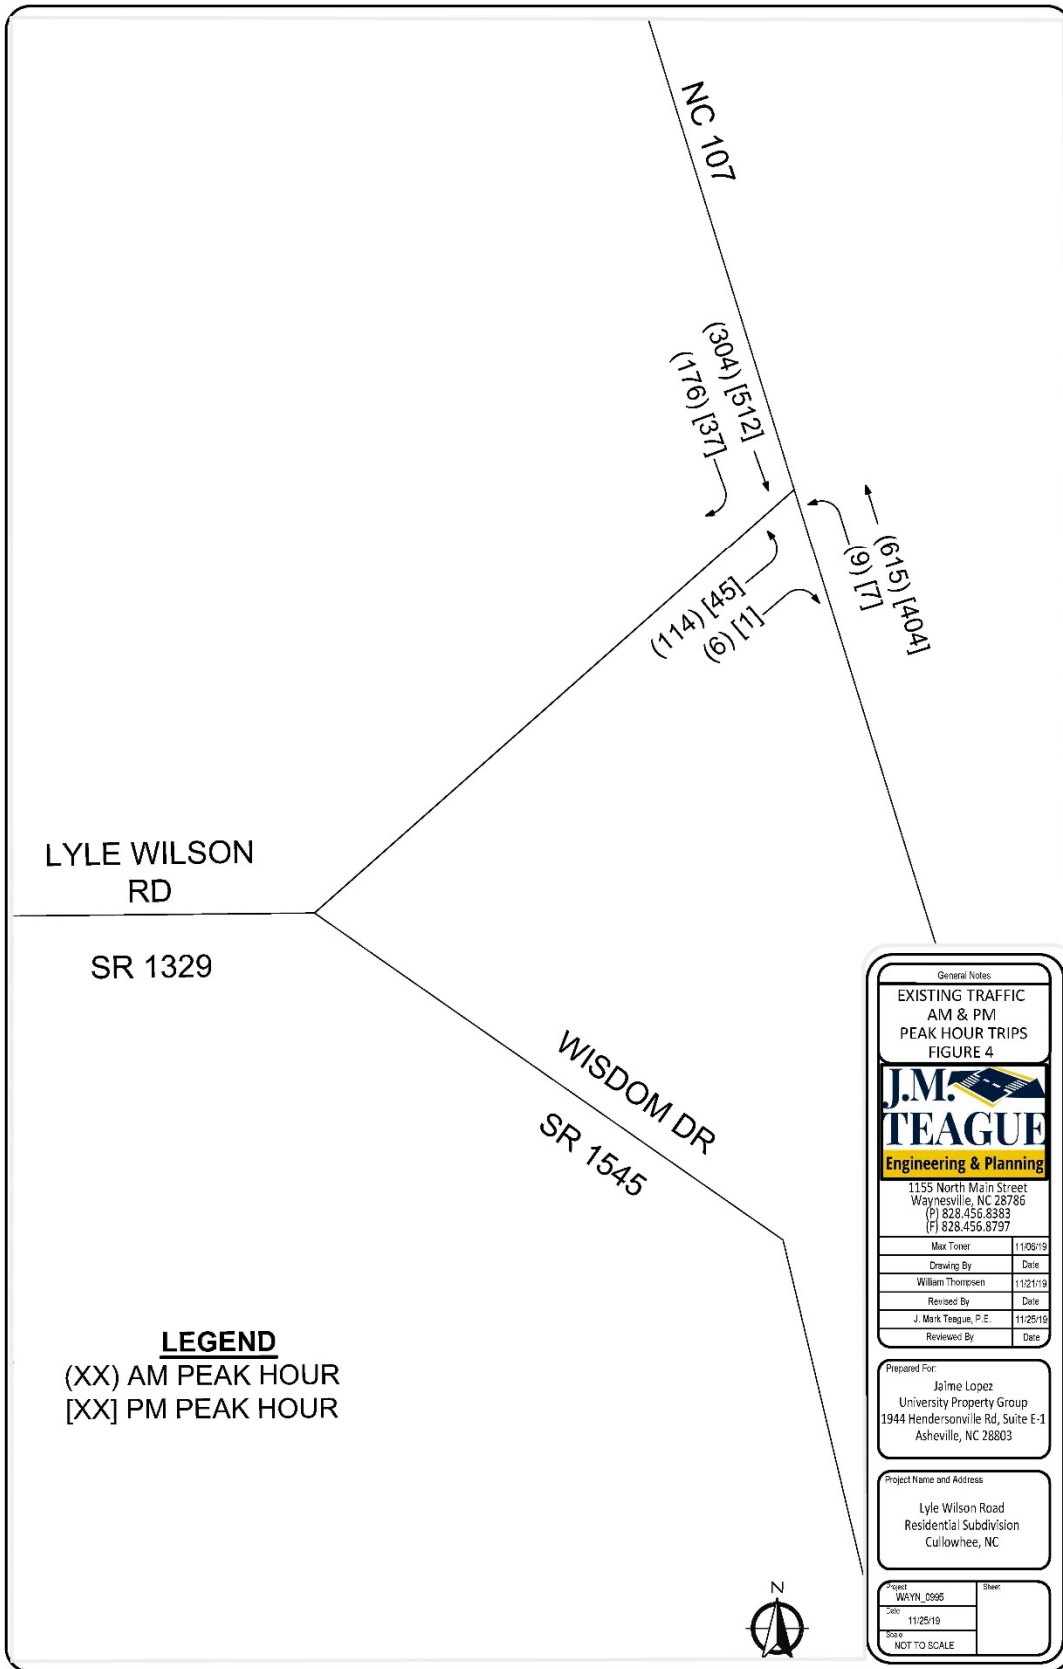

Like with most infrastructure, it is desirable and most effective to design the roadway network in an optimal manner, while promoting travel and minimizing the environmental footprint. With this in mind, it is desirable for roads to operate at volumes consistent with lower levels of delay during non-peak times as well as higher levels of delay during peak periods.

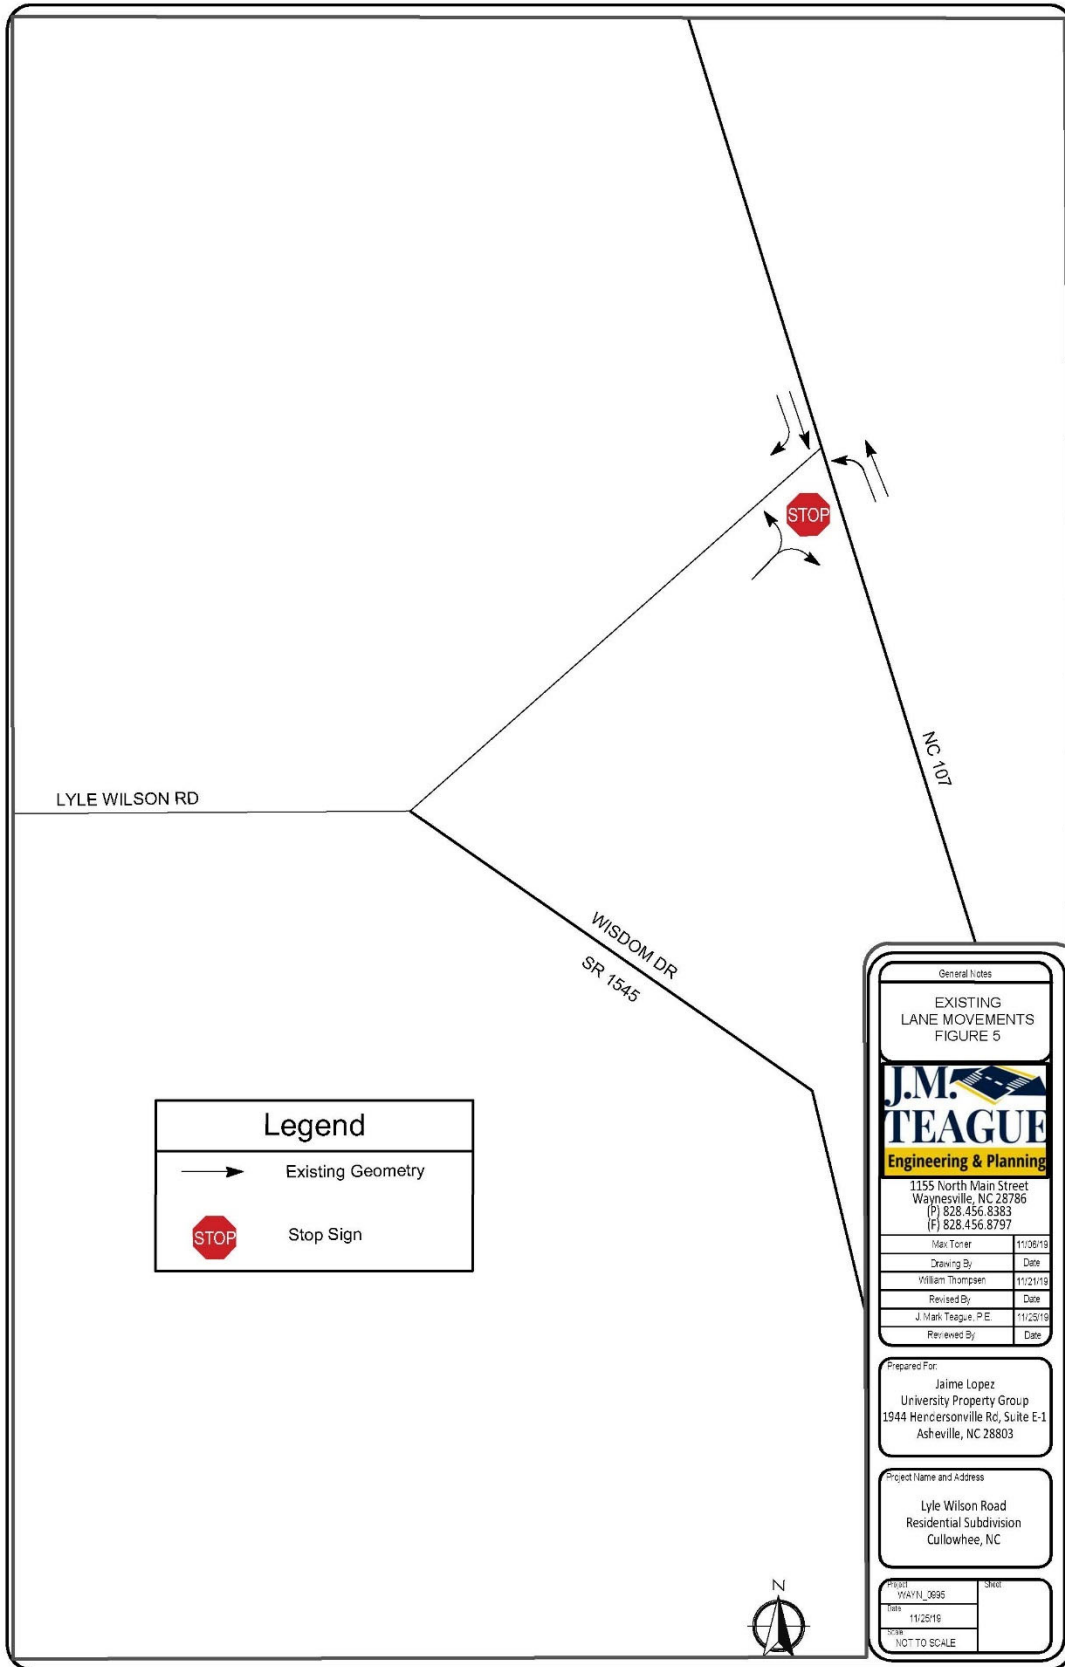

The analysis for un-signalized intersections can project very high delays on the side street, thus it is recommended to use LOS measurements as a comparative tool rather than a design tool. The 95<sup>th</sup> Queue is defined to be the vehicle queue (back-up) that has only a 5% probability of being exceeded during the analysis period. At un-signalized intersections,  $p_0$  is the probability of a queue-free state.

## **Existing Traffic**

In order to determine existing traffic, a peak period turning movement count was conducted at NC 107 and Lyle Wilson Road and in accordance with the methodology previously explained.

The existing peak hour volumes are shown in *Figure 4*. The existing lane diagram is shown in *Figure 5*. The existing turning movement counts can be found in Appendix B.

## **Background Traffic**

Background traffic is defined as the traffic that would be at the studied intersections at the time of anticipated project completion (build-out), without the proposed development. Background traffic is comprised of existing traffic and any increase or decrease in volumes which might occur from general growth trends in the surrounding area or from nearby specific developments. A growth factor of 2% was utilized for this study up to the anticipated project completion year (build-out) of 2022. The anticipated background traffic is shown in *Figure 6*.

## Trip Generation

The 10<sup>th</sup> edition of the Trip Generation Manual published by the Institute of Transportation Engineers (ITE) was used as a baseline to determine site generated traffic. As there is no land use code for twin homes the two ITE land use codes were utilized for the proposed development which is Land Use Code 210 – Single-family Housing and LUC 220 – Multifamily Housing (Low-Rise). The ITE 10<sup>th</sup> edition trip manual defines LUC 210 as “Single-family detached housing includes all single-family detached homes on individual lots.” According to ITE’s Trip Generation manual, LUC 220 – Multifamily Housing is described as “Low-rise multifamily housing includes apartments, townhouses, and condominiums located within the same building with at least three other dwelling units and that have one or two levels (floors).”

Trip generation volumes were calculated utilizing the fitted curve equation for LUC 210 and LUC 220 for the peak hours of adjacent street traffic according to the NCDOT guidelines. The ITE equations for weekday total, AM peak hour, and PM peak hour are as follows:

- **LUC 210 Single-Family Housing (Low Rise)**
  - Weekday Equation
    - $\ln(T) = 0.92 \ln(X) + 2.71$  : 50% Entering / 50% Exiting
  - AM Peak Hour of Adjacent Street Traffic
    - $T = 0.71(X) + 4.80$  : 25% Entering / 75% Exiting
  - PM Peak Hour of Adjacent Street Traffic
    - $\ln(T) = 0.96 \ln(X) + 0.20$  : 63% Entering / 37% Exiting
  
- **LUC 220 Multifamily Housing (Low Rise)**
  - Weekday Equation
    - $T = 7.56(X) - 40.86$  : 50% Entering / 50% Exiting
  - AM Peak Hour of Adjacent Street Traffic
    - $\ln(T) = 0.95 \ln(X) - 0.51$  : 23% Entering / 77% Exiting
  - PM Peak Hour of Adjacent Street Traffic
    - $\ln(T) = 0.89 \ln(X) - 0.02$  : 63% Entering / 37% Exiting

The typical weekday trip generation volumes are shown below in *Table 2*

ITE Land Use Code	Size	Unit	ADT (vpd)	AM Peak (vph)		PM Peak (vph)	
				IN	OUT	IN	OUT
<b>210 – Single Family</b>	27	Dwelling units	312	6	18	18	11
<b>220 – Multifamily</b>	46	Dwelling units	307	5	18	19	11
		<b>Totals</b>	<b>619</b>	<b>11</b>	<b>36</b>	<b>37</b>	<b>22</b>

<Table 2>

The peak hour trips were assigned to the roadway network using the distribution percentages found in *Figure 8* and shown as AM & PM Peak Hour ingress and egress site generated trips in *Figure 7*.

## **Trip Distribution**

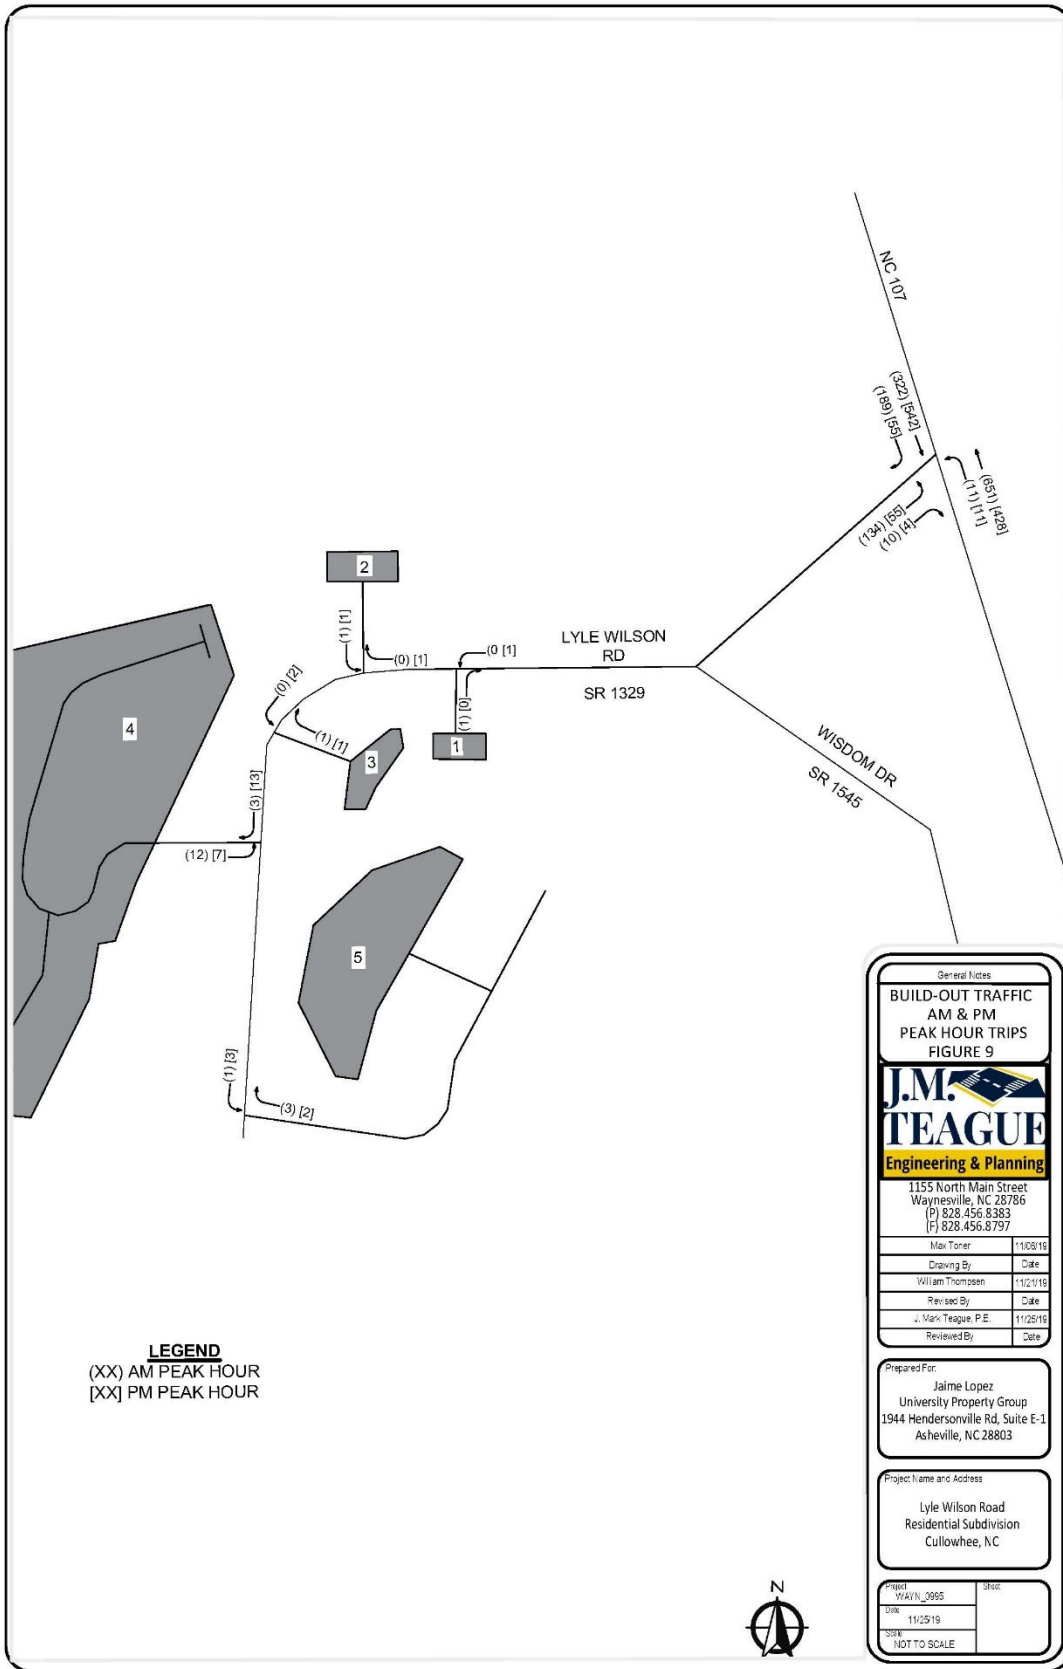

The trip distribution for this development was estimated from the existing traffic volume patterns within the surrounding roadway network, the surrounding population densities, the location of the proposed development, and engineering judgment. Trip distribution percentages can be seen in *Figure 8*.

## **Build-Out Traffic**

Build-out traffic is defined as the total traffic volume that will be present on the surrounding roadway network at the time of project completion and full occupancy. The build-out year is projected to be 2022. Build-out traffic was calculated by adding the background traffic and the proposed site traffic, which is distributed in the AM & PM peak hour periods according to the entering and exiting percentages listed above in (*Table 2*) and found in the ITE trip generation manual. *Figure 9* shows the anticipated build-out AM & PM Peak Hour traffic.

### Analysis of Existing Traffic Conditions

The analysis of existing conditions was based on the methodology presented in NCDOT’s Congestion Management Capacity Analysis Guidelines. In order to estimate the existing LOS, delay, v/c ratio, and queue at the study intersections, the existing traffic volumes from the AM & PM peak hours were analyzed using existing lane configurations and traffic control conditions (Table 3). Since existing turning movement count data was collected, the existing peak hour factor (PHF) was utilized for analyzing existing conditions.

The capacity analysis (Synchro Reports) for the existing conditions can be found in Appendix C.

### Analysis of Existing AM/PM Peak Hour Traffic Conditions

Intersection	Approach	Lane	Queue Length (ft)	LOS	Delay (sec)	V/C Ratio	Queue Length (ft)	LOS	Delay (sec)	V/C Ratio
			[AM]	[AM]	[AM]	[AM]	[PM]	[PM]	[PM]	[PM]
Old Cullowhee Road (NC 107) @ Lyle Wilson Road (SR 1329)	Northbound	Left	14	A	8.7	0.02	17	A	8.8	0.01

	Southbound	Thru	0	--	0	0.19	0	--	0	0.32
	Southbound	Right	0	--	0	0.15	0	--	0	0.05
	NE bound	Left/Right	102	E	42.7	0.65	38	D	25.8	0.35

<Table 3>

## Analysis of Background Traffic Conditions

The analysis of background conditions was based on the methodology presented in NCDOT's *Congestion Management Capacity Analysis Guidelines*. In order to estimate the background LOS, delay, v/c ratio, and queue at the study intersections, the background traffic was analyzed using existing lane configurations and traffic control conditions (*Table 4*). A PHF of 0.90 was utilized for all background conditions in accordance with NCDOT guidelines.

The capacity analysis (Synchro Reports) for the existing conditions can be found in Appendix C.

### Analysis of Background AM/PM Peak Hour Traffic Conditions

Intersection	Approach	Lane	Queue Length (ft)	LOS	Delay (sec)	V/C Ratio	Queue Length (ft)	LOS	Delay (sec)	V/C Ratio
			[AM]	[AM]	[AM]	[AM]	[PM]	[PM]	[PM]	[PM]
Old Cullowhee Road (NC 107) @ Lyle Wilson Road (SR 1329)	Northbound	Left	14	A	8.6	0.01	14	A	8.9	0.01
	Northbound	Thru	0	--	0	0.43	0	--	0	0.28
	Southbound	Thru	0	--	0	0.21	0	--	0	0.35
	Southbound	Right	0	--	0	0.12	0	--	0	0.03
	NE bound	Left/Right	83	E	39.3	0.59	42	C	24.5	0.22

<Table 4>

### Analysis of Build-out Traffic Conditions

The analysis of build-out conditions was based on the methodology presented in NCDOT’s Congestion Management Capacity Analysis Guidelines. In order to estimate the build-out LOS, delay, v/c ratio, and queue at the study intersections, the build-out traffic was analyzed using existing lane configurations and traffic control conditions as well as the addition of the proposed site access points. A PHF of 0.90 was utilized for all build-out conditions in accordance with NCDOT guidelines. The build-out LOS, delay, v/c ratio, and queue at the study intersections in the AM and PM peak hours are below (Table 5). The capacity analysis (Synchro Reports) for the build-out conditions can be found in Appendix C.

#### Analysis of Build-out AM/PM Peak Hour Traffic Conditions

<Table 5>

## **CONCLUSIONS AND RECOMMENDATIONS**

The mitigation recommendations for the studied intersection was based on NCDOT's *Policy on Street and Driveway Access to North Carolina Highways* (Driveway Manual) methodology and mitigation threshold requirements, and engineering judgment.

According to NCDOT, mitigation improvements are required to the studied roadway network if at least one of the following conditions exists when comparing base network conditions to project build-out conditions:

- Average intersection or approach delay increases by 25% or greater while maintaining the same LOS,
- LOS degrades by at least one level
- LOS is F

### ***Old Cullowhee Road (NC 107) @ Lyle Wilson Road (SR 1329)***

As can be seen in *Table 6*, the difference in LOS, delay, v/c ratio, and queue between background traffic and build-out traffic are only minimally increased for northeast bound during the AM and PM peak hours. In particular, the northeast bound left-turn movement LOS E remains the same in the AM peak hour, and the LOS declines from C to D in the PM peak hour. The LOS decreases remain at acceptable levels and these minor increases in delay are acceptable because the delay increase of 15 percent AM peak hour and the 4 percent PM peak hour increases are below NCDOT's mitigation thresholds.

The peak hours for data analysis were derived from the ITE Trip Generation 10<sup>th</sup> edition and the study times of 7 AM to 9AM and 4 PM to 6 PM of the LUC for the proposed development. The observed existing peak hour factors (PHF) of NC 107 were between the PHF values between 0.89 to 0.92. The NCDOT guidelines for future year analysis prescribe the use of PHF 0.90 which is in line with the observed values of NC 107. The existing analysis shows that the observed 7 AM to 9 AM peak hour traffic flow consists largely of school traffic which comes off of Wisdom Drive. The build-out conditions of the proposed project analysis shows the additional 18 projected AM trips and 11 PM trips contributing to the increase delay at Lyle Wilson Road at NC 107. In the AM build-out conditions, only 12 percent of the approach volume is proposed project generated trips while 88 percent of the volume is school generated trips at the intersection of Lyle Wilson Road and NC 107.

**Comparison of Existing, Background, and Build-Out Peak Hour Traffic Conditions**

Intersection	Approach	Lane	Hour	Existing				Background				Build-out					
				Queue Length (ft) [Exist]	LOS [Exist]	Delay (sec) [Exist]	V/C Ratio [Exist]	Queue Length (ft) [BG]	LOS [BG]	Delay (sec) [BG]	V/C Ratio [BG]	Queue Length (ft) [BO]	LOS [BO]	Delay (sec) [BO]	V/C Ratio [BO]	Background vs Build-out Delay Increase %	Background Queue & Build-Out Queue Difference (FT)

## Proposed Site Plan

NOTE: THIS PLAN HAS BEEN DEVELOPED USING NC LIDAR DATA. THE BOUNDARY SURVEYS BY DAVENPORT, IVEY & ASSOC., INC. ALL INFORMATION SHOWN ON THIS PLAN IS APPROXIMATE AND IS INTENDED FOR CONCEPTUAL PLANNING PURPOSES ONLY. THIS PLAN IS NOT INTENDED TO IN ANY WAY REPRESENT A FINAL DESIGN. THIS PLAN SHOULD NOT BE USED FOR THE SALE OR CONVEYANCE OF LAND OR RIGHT OF WAY OR FOR CONSTRUCTION PURPOSES. DESIGNS WILL BE FINALIZED AT A LATER DATE AND MAY REQUIRE ADDITIONAL MODIFICATIONS TO THIS CONCEPTUAL SITE PLAN. THIS CONCEPTUAL PLAN IS NOT INTENDED TO SHOW PRELIMINARY SITE DESIGN FOR INDIVIDUAL LOTS. ADDITIONAL WALLS AND IMPROVEMENTS WILL BE REQUIRED ON INDIVIDUAL LOTS TO ACCOMMODATE HOME CONSTRUCTION. THE PRELIMINARY LOCATIONS AND EXTENT OF PROPOSED EARTH SLOPES AND RETAINING SYSTEMS SHOWN ARE BASED ON ASSUMED GEOTECHNICAL PARAMETERS. THIS CONCEPT IS BASED ON THE ASSUMPTION THAT 1:5 HORIZONTAL TO 1 VERTICAL CUT SLOPES AND 1:1 HORIZONTAL TO 1 VERTICAL FILL SLOPES WILL BE FOUND TO BE SUITABLE FOR SITE SPECIFIC SOIL CONDITIONS. IT IS THE OWNER'S RESPONSIBILITY TO ENGAGE THE SERVICES OF A QUALIFIED NC GEOTECHNICAL ENGINEER TO EVALUATE SITE SPECIFIC SOIL CONDITIONS PRIOR TO PROCEEDING WITH FINAL PROJECT PLANNING.
